MM1E1

The principle is to use bony prominences to support the pelvis and the chest in the lateral decubitus position. Anteriorly, the hipGRIP II® supports the symphysis pubis and the down side anterior superior iliac spine. The posterior pelvis support is placed over the sacral area and the two posterior superior iliac spines.

The Anterior Pelvic Support has an improved design for use in obese patients. An improved Angle Bar, now called the “? Bar” can be used to position the patient for anterior hip surgery techniques. The anterior and posterior chest supports keep the trunk/upper body in the lateral position and allows the table to be rolled without loss of position relative to the operating table.

Improvements from the original hipGRIP®

Now designed to better hold **morbidly obese patients**
(while still fits most body types)

- Now can be used for Anterior **or** Posterior surgical approach
- NEW Anterior Pelvic Support design (Right and Left) See "B"
